SCHEMA

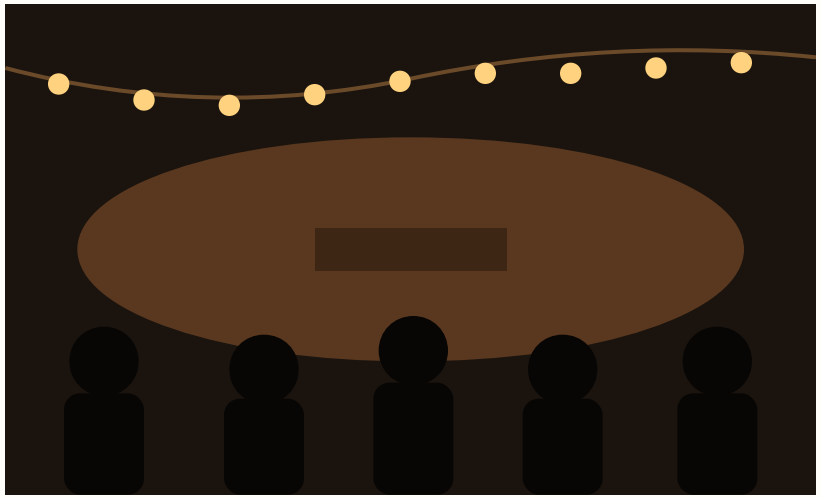

Schema keeps the story behind your photos

A private journal for the details a photo misses. You write the notes. We add event facts from the event's own page, and you approve each one.

Tushar Aggarwal · DTU · Solo participant
AZINHACK 2026 · Online project submission

M 001 · OCTOBER — Illustrative example

The courtyard gig

“I almost skipped this night.”

Your note (1)

Public context (2) · Waiting for your approval

A photo keeps the scene. The details walk away.

25,000 days in a long life. We remember almost none.

WHO IT IS FOR

College students, 18 to 30, who already photograph their days.

WHAT WE HAVE HEARD

We talked to fellow students. They liked the idea. Privacy was their main worry, so we built the design around it (slides 5 and 6).

WHAT A PHOTO CANNOT HOLD

A stranger arguing outside the gate

A kid who smiled when you gave ₹50

Who was there, and why it mattered

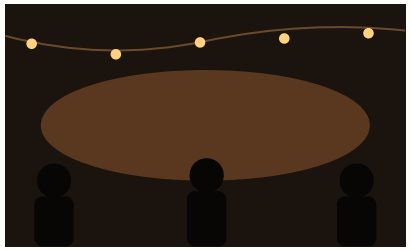

WHY WE ARE BUILDING THIS

Years ago I read about "schema": the idea that our minds build a map of reality. Then I counted my days and saw I remember almost none of them. Photos help, but they miss the small things. I could not find a journal that keeps them, so I am building one.

Tushar, founder

One page holds your memory and where each fact came from

THE COURTYARD GIG · ILLUSTRATIVE EXAMPLE

YOUR NOTE (1)

With Dev and Sana. The guard and a stranger argued at the gate all night.

PUBLIC CONTEXT (2)

Courtyard stage · Sat 10 Oct

From the event page you linked. We keep the source and the time.

Confirmed by you

1 **Add photos and write what you would forget**

2 **Paste a link to the event page**

TinyFish reads it and finds the public facts: title, date, venue.

3 **Check each fact, then save**

Nothing reaches your page unless you approve it.

Later: browse your pages by year, and share one page with the friends who were there.

TinyFish reads the event page. You approve what it finds.

1. You paste an event link → **2. TinyFish agent** opens the page and its schedule and lineup tabs → **3. A short list of facts** title, date, venue, source text → **4. You confirm or edit each fact**

HOW WE CALL IT

Our server sends TinyFish a public event URL and a fixed goal. Its agent browses in the background; we poll for results. Only the selected public facts enter an editable journal draft.

WHY AN AGENT

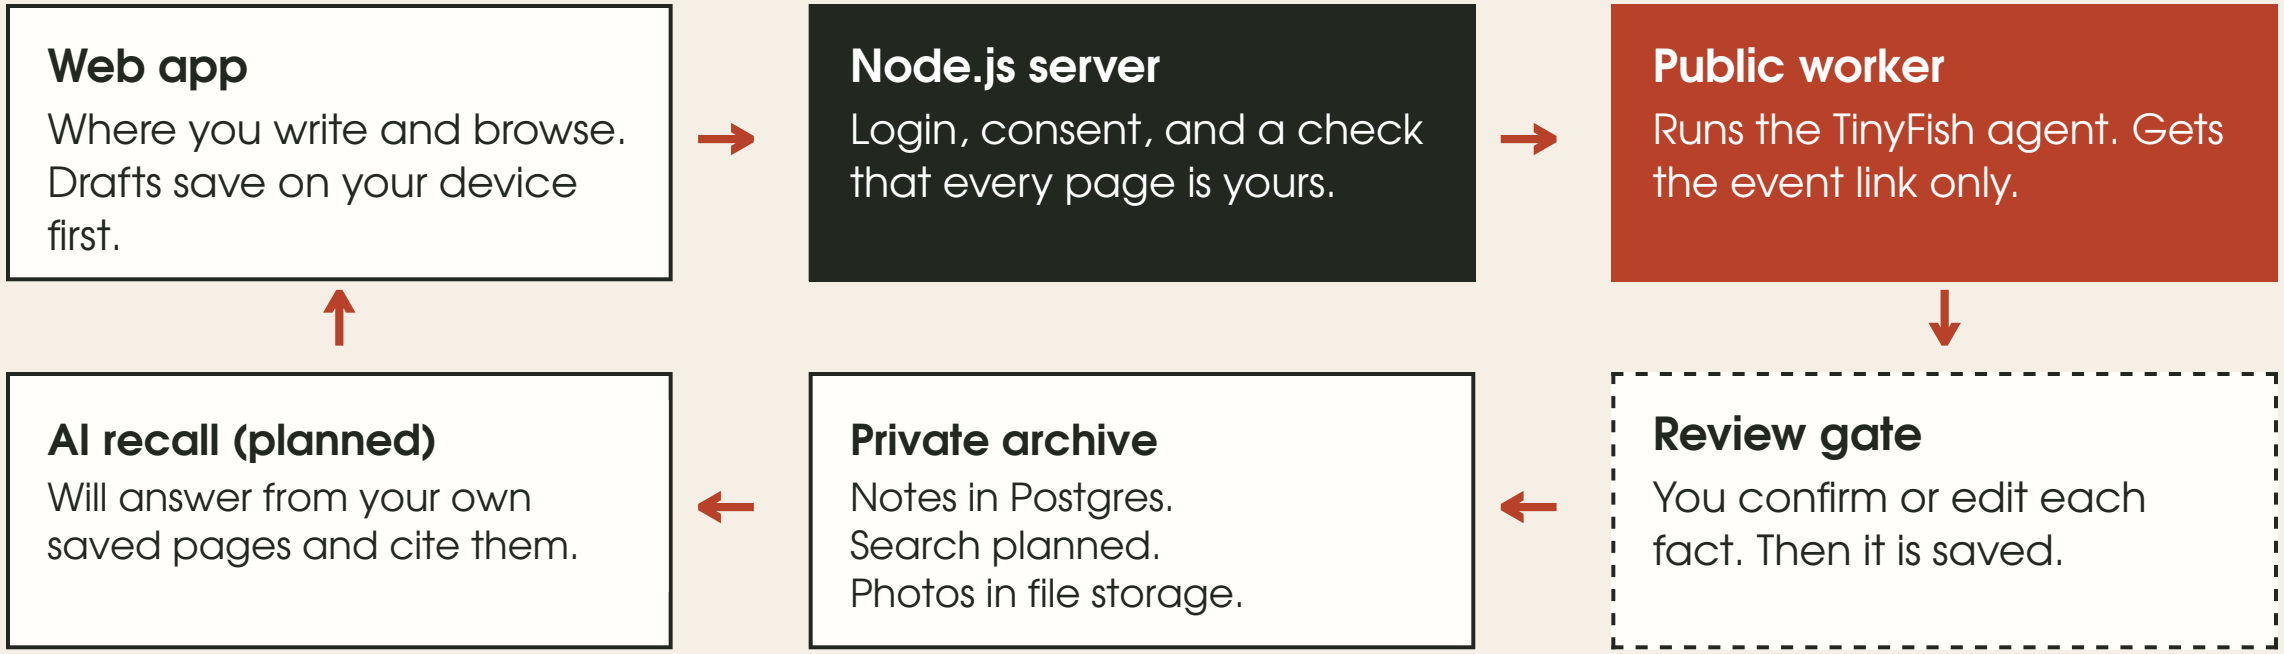

Details like set times often hide behind tabs and buttons that a basic page download never shows. An agent can click through them. Simple pages can use a basic download.

IF IT FAILS

TinyFish only gets the public link and the list of fields, never your notes or photos. If a page blocks it, those fields stay empty and your draft is kept.

CODE READY · Live TinyFish extraction to be tested on 21–22 October.

Your private pages and public web research never mix

Scale: photos live in file storage. TinyFish runs on user-provided public links; demo usage is restricted to approved accounts. Live cost and reliability tests are still needed.

Privacy: every read checks the owner. Deleting a page also deletes its search data. Notes and photos never go to TinyFish.

Every answer points back to something you saved

Who was with me that night?

Dev and Sana.

From your note (1)

Where was it, and when?

Courtyard stage, Sat 10 Oct.

From the event page (2), confirmed by you

What was the last song?

That is not in your saved sources.

No source, no answer

THE RULES

Facts about you come only from your own words.

Public facts keep their source and wait for your approval.

You can hide any page from AI at any time.

Illustrative example.

A private prototype. One focused memory loop for AZINHACK.

SOLO DEVELOPMENT PLAN · 21–22 OCTOBER

ONE TEST CASE

2 photos, 1 note,
1 public event link,
1 source-backed answer.

WHY THIS IS FEASIBLE

A private Schema prototype already exists. The hackathon focuses on one integration and a verifiable result.

PRIVACY IS NON-NEGOTIABLE

The agent only receives public links, not private journal text.

How we reach people, keep them, and earn from it

REACH

DTU first, through WhatsApp groups. Opt-in only. Nobody is pushed.

HABIT

A page takes about a minute. One optional question. No streaks, no guilt.

SOCIAL

Share one page with the friends who were there. Everything else stays private.

PRICING IDEA (TO BE TESTED)

	Free	Plus
Price	₹0	₹99 / month
Photos	2 GB	25 GB
AI questions	10 / month	150 / month

Price and limits are guesses. First we will measure what storage, AI use and TinyFish runs cost per saved page.

Where we sit. Google Photos organises photos. Journal apps like Day One are built around text. Schema combines your own words with event facts checked against their source. Our pilot will test whether that is worth paying for.

What we will prove, and who will build it

FOUNDER · DTU · SOLO PARTICIPANT

Tushar Aggarwal

Integrated B.Sc. + M.Sc. in Data Science

WHAT ALREADY EXISTS

Private Schema prototype and product blueprint.
The original project remains untouched.

AZINHACK BUILD SCOPE

TinyFish event research, fact approval, and cited AI memory answers in an isolated copy.

OUR PROPOSED TESTS

5 adult users. Goal: 4 save a page without help.

10 public event pages. Goal: 9 return every fact correctly.

20 memory questions. Goal: no answer without a source.

At the finale we will save a page and answer a question with a source you can check.
